Sums involving the largest prime divisor of an integer

by

JEAN-MARIE DE KONINCK (Quebec) and
R. SITARAMACHANDRARAO* (Toledo, Ohio)

1. Introduction. Let \( \gamma(n) \) denote the largest square-free divisor of \( n \) and for \( n \geq 2 \), \( P(n) \) denote the largest prime divisor of \( n \). In response to a suggestion of P. Erdős, G. J. Riegel (see [5]) and also [6], p. 85 proved that as \( x \to \infty \)

\[
\sum_{2 \leq n \leq x} \frac{1}{n \log \gamma(n)} = \log \log x + C + O\left( \frac{\log \log x}{\log x} \right).
\]

(1.1)

\[
\sum_{2 \leq n \leq x} \frac{1}{n \log P(n)} = e^\gamma \log \log x + O(\log \log \log x)
\]

(1.2)

where \( C \) is a constant and \( \gamma \) denotes the Euler constant. G. J. Riegel [5] also mentions that (1.1) with a weaker remainder term and (1.2) as it stands were also stated independently by P. G. Schmidt. In recent times sums involving the function \( P(n) \) have been investigated extensively (see for instance, N. G. De Bruijn [1], J. M. De Koninck and A. Ivić [2] and A. Ivić [4]).

The purpose of this paper is to sharpen the results (1.1) and (1.2) considerably. In fact we prove

Theorem 1.1. For each positive integer \( k \), there exist constants \( b_0, b_1, \ldots, b_{k-1} \), such that

\[
\sum_{2 \leq n \leq x} \frac{1}{n \log \gamma(n)} = \log \log x + \sum_{m=0}^{k-1} b_m \left( \frac{1}{\log x} \right)^m + O\left( \frac{1}{(\log x)^k} \right)
\]

Theorem 1.2. \( \sum_{2 \leq n \leq x} \frac{1}{n \log P(n)} = e^\gamma \log \log x + O(1) \).

In Section 2, we prove a general result for a wide class of arithmetical functions of which Theorem 1.1 will be a simple consequence. Our attempts to sharpen Theorem 1.2 still further were not successful.

* On leave from Andhra University, Waltair, India.
2. Proof of Theorem 1.1. First we prove a general result. Let \( r \) be an integer \( \geq 2 \). A positive integer \( n \) is called \( r \)-free if \( n \) is not divisible by the \( r \)th power of any prime. A positive integer \( n \) is called \( r \)-full if \( p|n, p \) a prime implies \( p^r|n \). Let \( Q_r \) (resp. \( L_r \)) denote the set of all \( r \)-free (resp. \( r \)-full) integers. Let \( q_r \) (resp. \( l_r \)) denote the characteristic function of \( Q_r \) (resp. \( L_r \)). Further, let \( \zeta(s) \) denote the Riemann zeta function, \( \omega(n) \) the number of distinct prime factors of \( n \) and \( \psi_r \) be the generalized Dedekind \( \psi \)-function of order \( r \) defined by

\[
\psi_r(n) = n \prod_{p|n} \left(1 + \frac{1}{p^r} + \cdots + \frac{1}{p^{r-1}}\right)
\]

where the product extends over all distinct prime factors of \( n \).

Let \( S_r \) denote the class of all multiplicative arithmetical functions \( f \) satisfying

\[
f(p^m) = p^m \quad \text{for} \quad 1 \leq m \leq r - 1
\]

and

\[
f(p^m) \geq p^{m-1} \quad \text{for} \quad m \geq r
\]

and all primes \( p \).

Let \( T_r \) denote the class of all bounded arithmetical functions \( \chi \) satisfying

\[
\chi(mn) = \chi(m) \quad \text{whenever} \quad (m, n) = 1 \quad \text{and} \quad n \in Q_r.
\]

Further let \( \lambda \) be a real with \( -1/r \leq \lambda < 0 \) and define \( F: [\lambda, 0] \to C \) by

\[
F(t) = \frac{\chi(t)}{\zeta(t)(t+1)} \sum_{n=1}^{\infty} \frac{\chi(n) L_r(n)(f(n)n^{-1})}{\psi_r(n)}
\]

for \( f \in S_r \) and \( \chi \in T_r \) (the convergence of the series on the right will be proved in Lemma 2.3 below).

THEOREM 2.1. Let \( f \in S_r \) and \( \chi \in T_r \). Then for each fixed \( \varepsilon > 0 \) and as \( x \to \infty \)

\[
\sum_{n \leq x} \chi(n) \frac{f(n)}{n^r} = F(t) x + O_{\varepsilon,x}(x^{1+1/2+\varepsilon})
\]

uniformly for \( t \in [\lambda, 0] \).

The proof of Theorem 2.1 is based on the following three lemmas.

**Lemma 2.1 (cf. [7], Lemma 2).**

\[
\sum_{\substack{n \leq x \\text{and} \\gcd(n,x) = 1}} q_r(m) = \frac{nx^{1+1/\rho}}{\zeta(\rho) \psi_r(n)} + O_x(\theta(n) x^{1/\rho})
\]

uniformly in \( x \geq 1 \) and \( n \geq 1 \). Here \( \theta(n) = 2^{o(n)} \).

**Lemma 2.2.**

\[
\sum_{\substack{m \leq x \\text{and} \\gcd(m,x) = 1}} q_r(m) m^t = \frac{nx^{1+1/\rho}}{\zeta(\rho) \psi_r(n)(t+1)} + O_x(\theta(n) x^{1/\rho})
\]

uniformly in \( x \geq 1 \), \( n \geq 1 \) and \( t \in [\lambda, 0] \).

**Proof.** This follows from Lemma 2.1 and the theorem of partial summation.

**Lemma 2.3.** Let \( f \in S_r \). Then for each fixed \( \varepsilon > 0 \) and as \( x \to \infty \)

\[
\sum_{n \leq x} l_r(n)(f(n)n^{-1}) = O_{\varepsilon,x}(x^{1+1/2+\varepsilon}),
\]

\[
\sum_{n > x} l_r(n)(f(n)n^{-1}) = O_{\varepsilon,x}(x^{1+1/2+\varepsilon})
\]

and

\[
\sum_{n > x} \frac{l_r(n)(f(n)n^{-1})}{n^{1/r}} = O_{\varepsilon,x}(x^{1+1/2+\varepsilon})
\]

uniformly in \( t \in [\lambda, 0] \).

**Proof.** Let \( \alpha \geq (1 - \lambda)/r + \varepsilon \). Since \( t \leq 0 \), we have by (2.3)

\[
\sum_{m = r}^{\infty} (f(p^m)p^{-m}) \leq \sum_{m = r}^{\infty} (p^{-m}r^{-1/\rho}p^{-m})
\]

\[
= \frac{pr^{-1/\rho}p^{-r(\alpha+\varepsilon)}}{1 - p^{-r(\alpha+\varepsilon)}} \leq p^{-\alpha x + 1} (1 - 2^{-\alpha + 1})^{-1}
\]

on noting that \( rx + \lambda \geq 1 + ra \) and

\[
\alpha + t \geq \alpha + x \geq \frac{1}{r} + \lambda + \varepsilon = \frac{1}{r} + \lambda \left(\frac{t-1}{r}\right) + \varepsilon \geq \frac{1}{r} + \frac{t-1}{r^2} + \varepsilon = \varepsilon + \frac{t}{r} > 0.
\]

Hence the infinite product

\[
\prod_p \left(1 + \sum_{m = r}^{\infty} \frac{(f(p^m)p^{-m})}{p^{m\alpha}}\right)
\]

and consequently the series

\[
\sum_{n = 1}^{\infty} l_r(n)(f(n)n^{-1})
\]

converge.
Further by (2.9)

\[ \sum_{n=1}^{\infty} \frac{L(n)(f(n)n^{r})^{-1}}{n^{s}} = \prod_{p} \left[ 1 + \sum_{m=1}^{\infty} \left( \frac{f(p^m)}{p^{m(1+r)}} \right) \right] \leq \prod_{p} \left[ 1 + \frac{q_{p}}{p^{1+r}} \right]. \]

Hence

\[ \sum_{n \geq x} \frac{L(n)(f(n)n^{r})^{-1}}{n^{s}} \ll \frac{1}{r+1}, \]

uniformly for \( t \in [\lambda, 0] \) and (2.6), (2.7) and (2.8) follow by the theorem of partial summation.

Now we are in a position to give a proof of Theorem 2.1.

Each positive integer \( n \) can be written uniquely as \( n = d\delta \), \( (d, \delta) = 1 \) where \( d \in Q \) and \( \delta \in L_{r} \). Hence by (2.2) and (2.4)

\[ \sum_{n \geq x} \frac{\chi(n)}{n^{s}} = \sum_{\delta \geq x} \frac{\chi(\delta)}{\delta^{s}} \sum_{d \leq x^{1/\delta}} \frac{q_{d}(\delta)}{d^{1+r}} \]

\[ = \sum_{\delta \geq x} \frac{\chi(\delta)}{\delta^{s}} \sum_{d \leq x^{1/\delta}} \frac{q_{d}(\delta)}{d^{1+r}} \sum_{\delta \geq x} \frac{\chi(\delta)}{\delta^{s}} \sum_{d \leq x^{1/\delta}} \frac{q_{d}(\delta)}{d^{1+r}} \]

\[ = \sum_{\delta \geq x} \frac{\chi(\delta)}{\delta^{s}} \sum_{d \leq x^{1/\delta}} \frac{q_{d}(\delta)}{d^{1+r}} \]

\[ = \sum_{\delta \geq x} \frac{\chi(\delta)}{\delta^{s}} \sum_{d \leq x^{1/\delta}} \frac{q_{d}(\delta)}{d^{1+r}} \sum_{\delta \geq x} \frac{\chi(\delta)}{\delta^{s}} \sum_{d \leq x^{1/\delta}} \frac{q_{d}(\delta)}{d^{1+r}} \]

\[ = \frac{x^{1/\delta} + \chi^{1/\delta}}{\zeta(\delta)} \sum_{\delta \geq x} \frac{\chi(\delta)}{\delta^{s}} \sum_{d \leq x^{1/\delta}} \frac{q_{d}(\delta)}{d^{1+r}} \]

\[ + O \left( \frac{x^{1/\delta} + \chi^{1/\delta}}{\zeta(\delta)} \sum_{\delta \geq x} \frac{\chi(\delta)}{\delta^{s}} \sum_{d \leq x^{1/\delta}} \frac{q_{d}(\delta)}{d^{1+r}} \right) \]

where in the above we used Lemma 2.2 and the fact that \( \chi \) is bounded and \( \psi(n) \geq n \) for all \( n \). Now Lemma 2.3 completes the proof of Theorem 2.1.

**Theorem 2.2.** Let \( f \in S_{r} \) and \( \chi \in T_{r} \). Then as \( x \to +\infty \)

\[ \sum_{2 \leq n \leq x} \frac{\chi(n)}{\log f(n)} = \chi(t) \int_{-1/r}^{0} F(t) \, dt + O \left( \frac{x^{1/\delta} + \chi^{1/\delta}}{\log x} \right) \quad \text{for} \quad r = 2, \]

and in particular, for each positive integer \( k \)

\[ \sum_{2 \leq n \leq x} \frac{\chi(n)}{\log f(n)} = \frac{x^{k-1} - 1}{\log x} + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

where for \( t \in [-1/r, 0] \)

\[ G(t) = x^{-t} F(t). \]

Further, for each positive integer \( k \), there exist constants \( b_0, b_1, \ldots, b_{k-1} \) such that

\[ \frac{x^{k-1} \zeta(k)}{\log x} + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

where \( \zeta(k) \) is the order constant depends on parameters other than \( x \).

**Proof.** The method of proof is similar to the one first used by J. M. de Koninck and J. Galambos [3] to estimate sums of reciprocals of certain additive functions. First, from Theorem 2.1, we get

\[ \sum_{2 \leq n \leq x} \frac{\chi(n)}{\log f(n)} = \chi(t) \int_{-1/r}^{0} F(t) \, dt + O \left( \frac{x^{1/\delta} + \chi^{1/\delta}}{\log x} \right) \]

Since \( \chi \) is bounded and \( f(n) \geq 2 \) for all \( n \geq 2 \), we have

\[ \Sigma := \sum_{2 \leq n \leq x} \frac{\chi(n)}{\log f(n)} = \sum_{2 \leq n \leq x} \frac{\chi(n)}{\log f(n)} \]

Again by Theorem 2.1, (with the function \( \chi(n) = 1 \) for all \( n, t = \lambda = -1/r \)) and the theorem of partial summation

\[ \Sigma \ll \sum_{2 \leq n \leq x} \frac{\chi(n)}{\log f(n)} \ll x^{-1/r} + x^{-1/r} (1 + r/\delta) + \sum_{2 \leq n \leq x} \frac{\chi(n)}{\log f(n)} \]

so that (2.10) follows from (2.14).

Now to prove (2.11), consider

\[ \int_{-1/r}^{0} F(t) \, dt = \int_{-1/r}^{0} x^{t} F(t) \, dt - \int_{-1/r}^{0} x^{t} F'(t) \, dt \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]

\[ = x \frac{G(0)}{\log x} - \int_{-1/r}^{0} x^{t} F'(t) \, dt + O \left( \frac{x^{k-1} \zeta(k)}{\log x} \right) \]
Since
\[
\int_{-1/r}^{0} \frac{x^{t} G(t)}{(\log x)^{n}} dt \ll (\log x)^{-k},
\]
(2.11) follows from (2.10).

Finally (2.13) follows from (2.11) by partial summation. This completes the proof of Theorem 2.2.

Now we deduce Theorem 1.1 from Theorem 2.2. First note that by Euler's infinite product factorization theorem
\[
\frac{1}{\zeta(2)} \sum_{n=1}^{\infty} \frac{\psi_{2}(n)}{n} = \frac{1}{\zeta(2)} \prod_{p} \left( 1 + \frac{1}{p} + \frac{1}{p^{2}} + \cdots \right) = 1.
\]

Hence on taking \( r = 2, f(n) = \gamma(n), \) the largest square-free divisor of \( n \) and \( c(n) = 1 \) for all \( n \) in Theorem 2.2, equation (2.13), we obtain Theorem 1.1.

As another application of Theorem 2.2, we have

**Corollary 2.1.** Let \( r, s \) be integers satisfying \( 2 \leq r \leq s \) and \( \gamma_{r}(n) \) denote the largest \( r \)-free divisor of \( n \). Then, for each positive integer \( k \), there exist constants \( a_{0}, a_{1}, \ldots, a_{k-1} \) such that as \( x \to \infty \)
\[
\sum_{2 \leq n \leq x} \frac{q_{r}(n)}{n \log \gamma_{r}(n)} = \frac{1}{\zeta(s)} \log \log x + \sum_{m=0}^{k-1} \frac{a_{m}}{(\log x)^{m}} + O\left( \frac{1}{(\log x)^{k}} \right).
\]

**Proof.** In Theorem 2.2, equation (2.13), we take \( f(n) = \gamma_{r}(n), \) \( \chi(n) = q_{s}(n) \) and note that in this case
\[
G(0) = F(0) = \frac{1}{\zeta(r)} \sum_{n=1}^{\infty} \frac{L_{r}(n) q_{s}(n)}{\psi_{r}(n)} = \frac{1}{\zeta(r)} \prod_{p} \left( 1 + \sum_{m=1}^{r-1} \frac{1}{\psi_{r}(p^{m})} \right)
\]
\[
= \frac{1}{\zeta(r)} \prod_{p} \left( 1 + \frac{1 - p^{-1}}{\log p} \left( p^{-r} - p^{-1} \right) \right)
\]
\[
= \frac{1}{\zeta(r)} \prod_{p} \left( 1 - p^{-r} \right) = \frac{1}{\zeta(s)}.
\]

This completes the proof of Corollary 2.1.

3. **Proof of Theorem 1.2.** For \( x \geq 1 \) and \( y \geq 2, \) let \( \psi(x, y) \) denote the number of positive integers \( \leq x \) all of whose prime factors are \( \leq y. \) Then it is known due to de Bruijn (cf. [1], (1.9)) that there exist positive constants \( A \) and \( B \) such that for all \( x \) and \( y \)
\[
\psi(x, y) \ll Ax \exp \{(B \log x / \log y)\}.
\]

Now clearly we have
\[
(3.2) \quad \sum_{n \leq x} \frac{1}{n \log P(n)} = \sum_{p \leq x} \frac{1}{\log p} \sum_{n \leq P(n)} \frac{1}{n} = \sum_{p \leq x} \frac{1}{p \log p} \sum_{m \leq x / p} \frac{1}{m}
\]
\[
= \sum_{p \leq x} \frac{1}{p \log p} \sum_{m \leq x / p} \frac{1}{m} = \sum_{p \leq x} \frac{1}{p \log p} \sum_{m \leq x / p} \frac{1}{m} = \Sigma_{1} - \Sigma_{2},
\]

say. By Mertens' theorem in the distribution of primes, we have
\[
(3.3) \quad \sum_{m \leq x / p} \frac{1}{m} = \left( 1 - \frac{1}{q} \right)^{-1} = \frac{1}{(\log p)^{2}} + O\left( \frac{1}{(\log p)^{2}} \right) = \epsilon p \log x + O(1)
\]
so that
\[
(3.4) \quad \Sigma_{1} = \sum_{p \leq x} \frac{1}{p \log p} (\epsilon p \log x + O(1)) = \epsilon p \log x + O(1).
\]

The estimation of \( \Sigma_{2} \) is done via partial summation and (3.1). In fact
\[
(3.5) \quad \Sigma_{2} = \sum_{2 \leq p \leq x} \frac{1}{p \log p} \left( \frac{\psi(t, p)}{t} \right)_{x/p}^{x} \int_{p}^{x} \frac{\psi(t, p)}{t^{2}} dt
\]
\[
= 1 + \sum_{p \leq x} \frac{1}{p \log p} \int_{p}^{x} \frac{dt}{(\log t)^{2}} \ll 1 + \sum_{p \leq x} \frac{1}{p \log p} \ll 1 + \sum_{p \leq x} \frac{1}{p \log p} \ll 1.
\]

Now the theorem follows from (3.2), (3.4) and (3.5).
